

# SubTrack — Project Documentation

Subscription Command Centre · Documentation and UI preview pack

**Runtime note:** The uploaded project was inspected directly. A real React localhost capture was attempted, but frontend dependency installation timed out in this environment. The screenshots below are therefore **source-faithful UI previews** based on the actual page structure, styling and components; they are not represented as verified live localhost captures.

## 1. Project Overview

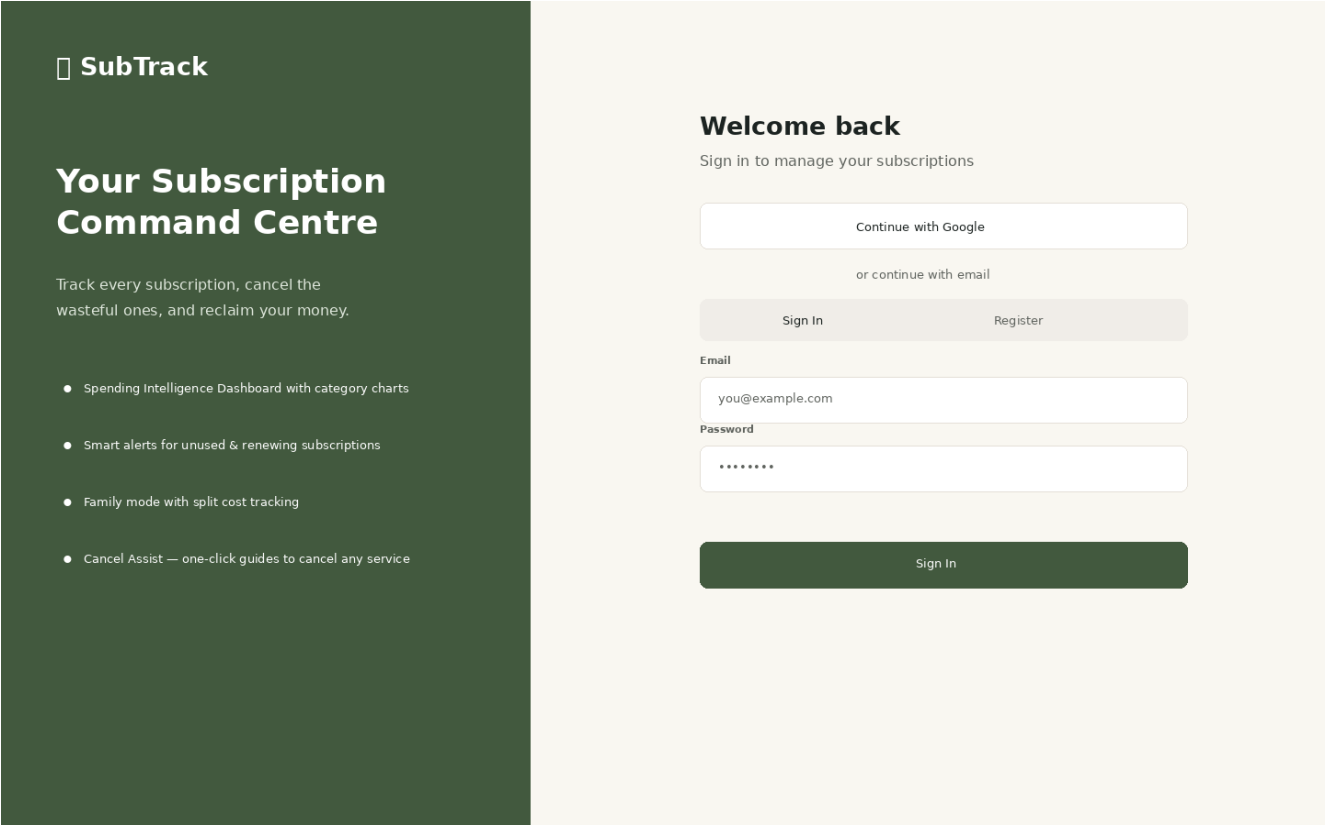

SubTrack is a React 18 + FastAPI subscription-management application for tracking subscription spending in ■, monitoring subscription health, receiving smart alerts, assisting cancellations, and splitting shared costs through Family Mode.

## 2. Technology Stack

| Layer          | Implementation                                                               |
|----------------|------------------------------------------------------------------------------|
| Frontend       | React 18, React Router, Tailwind CSS, Recharts, Radix/shadcn-style UI, Axios |
| Backend        | FastAPI, Motor (async MongoDB), bcrypt                                       |
| Database       | MongoDB                                                                      |
| Authentication | Email/password sessions + Google OAuth callback flow                         |
| Build          | Create React App + CRACO                                                     |

Version 1.0.0

## 4. Key Application Features

- Dashboard: monthly/yearly spend, wasted spend, health score, six-month spending trend, category breakdown and smart alerts.
- Subscriptions: add, edit, delete, filter, search, mark-used and launch Cancel Assist.
- Analytics: spending trend, category/health distribution and cancellation candidates.
- Cancel Assist: service-specific cancellation steps, cancellation URL, savings simulator and email template.
- Family Mode: family group creation, members and shared subscription cost splitting.
- Settings: profile, sign-out and authenticated password change.

## 5. Backend/API Surface

| Method       | Endpoint                                | Purpose                 |
|--------------|-----------------------------------------|-------------------------|
| POST         | /api/auth/register                      | Register                |
| POST         | /api/auth/login                         | Login                   |
| POST         | /api/auth/logout                        | Logout                  |
| GET          | /api/auth/me                            | Current user            |
| PUT          | /api/auth/change-password               | Change password         |
| GET / POST   | /api/subscriptions                      | List / create           |
| PUT / DELETE | /api/subscriptions/:id                  | Update / delete         |
| POST         | /api/subscriptions/:id/mark-used        | Mark used               |
| GET          | /api/subscriptions/:id/cancel-assist    | Cancellation guide      |
| GET          | /api/subscriptions/:id/cancel-simulator | Savings calculator      |
| GET          | /api/analytics/dashboard                | Dashboard stats         |
| GET          | /api/analytics/spending-trend           | Trend data              |
| GET          | /api/notifications                      | Notifications           |
| GET / POST   | /api/family                             | Read / create family    |
| POST         | /api/family/members                     | Add member              |
| POST         | /api/family/subscriptions               | Add shared subscription |

## 6. Patch / Hardening Changes

- Added authenticated PUT /api/auth/change-password.
- Added minimum password-length validation and current-password verification.
- Connected the Settings password form to the new backend endpoint.
- Hardened credentialed CORS around FRONTEND\_URL rather than a wildcard origin.
- Added PATCH\_NOTES.md for traceability.

## 7. Run Instructions

Backend: create a Python 3.10+ virtual environment, install backend/requirements.txt, configure MONGO\_URL, DB\_NAME, FRONTEND\_URL/CORS settings and SECRET\_KEY, then run **uvicorn server:app --reload --port 8001**. Frontend: from frontend/, run **npm install**, set REACT\_APP\_BACKEND\_URL=http://localhost:8001, then run **npm start**. Intended addresses: API http://localhost:8001 and frontend http://localhost:3000.

## 8. Verification Status

The ZIP was successfully unpacked and the principal frontend/backend source files were inspected. The app could not be truthfully marked as live-rendered in this environment because npm dependency installation timed out. This distinction is explicitly preserved in the documentation.
